

# Say **NO** to **FLOODING** and **PUDDLING**

During the rainy season, **50%** of puddling is caused by garbage

Mexico daily produces **86,000** tons of puddling is caused by garbage. 13% is found on the streets and 87% in landfills

## Keep in mind that...

Uncontrolled waste disposal blocks up rainwater flow, causing water stagnation, which becomes a source of infection and, in consequence, a hazard to health.

## To avoid puddling and flooding...

Keep the drains clean to avoid being obstructed by garbage

Put trash in its place; do not throw it on public spaces, drains, gullies and rivers

Notify the authorities about changes in rivers and streams, like the smell and the increase or decrease of water flow

Check that the drains and other structures are not blocked to allow free flow of rainwater

Keep the trees trimmed and collect leaves and branches to prevent water flow obstruction

Report vehicles that clandestinely discharge gravel or debris
