

The Senasica acts against AMR

Technical efforts against Antimicrobial Resistance

Antimicrobial Resistance (AMR) occurs due to the misuse of that type of drugs, which causes bacteria, fungus, virus and parasites to develop resistance and immunity.

To communicate the rational use of drugs among the livestock breeding sector, the Senasica, in support of academic and scientific institutions and agri-food producers' organizations, participates in the National Action Strategy against AMR, answering to the call by the World Health Organization.

In the setting of the Agricultural Outlook Forum it was disclosed that Mexico, under the direction of the Senasica, leads the efforts in the Antimicrobial resistance area, towards producing favorable results for the domestic and international agriculture and livestock sector.

The federal agency insisted to the ministries and secretariats of Agriculture of Argentina, Brazil, Canada and the United States that Mexico is working to redirect agricultural and livestock activities through modern and sustainable actions.
