

Our cattle deserve healthy and safe feed

The SENASICA supervises that the feed for our animals for consumption is free from the risk of introducing diseases

The SENASICA operates a control and surveillance system for offal and bovine byproducts and certifies their transformation processes for the manufacturing of feed

To obtain quality, healthy, and safe meat products, it is essential that animals are fed with products containing nutritional ingredients that are optimal for every species and ensure their health.

This is where the good manufacturing practices come into play, since they are a set of procedures and controls whose main aim is to minimize the physical, chemical, or biological contamination risks which could cause harm to the animals or introduce ruminant diseases such as the bovine spongiform encephalopathy (BSE), and scrapie.

To keep our cattle free of said diseases, the SENASICA operates a control and surveillance system for offal and bovine byproducts and certifies their transformation processes for the manufacturing of feed.

Likewise, to protect the health of animals for consumption, the Secretariat of Agriculture and Rural Development published in the Federal Official Gazette the Mexican Official Standard NOM-060-SAG/ZOO-2020, which regulates the transformation of livestock sourced offal that is used in the manufacturing of animal feed.
