

# Orchards Certified as Temporarily Free of Native Fruit Flies

## HTLMF

An HTLMF is an orchard in which no fruit fly adults or larvae have been detected 60 days prior to the first cutting and during the production season; based on phytosanitary monitoring and fruit fly control measures.

It is essential to carry out preventive control measures to ensure the absence of the pest; subsequently, a surveillance system must be maintained to corroborate its absence or, if necessary, to detect any incursion of the pest in a timely manner.
