

Strengthening knowledge and evidence of RAM through surveillance and research in both human and animal health

Objective 2 involves the following strategies: establishing intersectoral coordination mechanisms for surveillance in human health, including at a community, hospital and health levels, as well as in animal health and the environment in order to reduce morbidity by 30%; developing and strengthening analytical capacity to conduct RAM surveillance and monitoring in human, animal and environmental health; as well as promoting basic, operational and economic research on RAM and the use of antimicrobials.
