

# We improved our relationship with technicians from the land of the maple leaf

Binational cooperation to address common issues

Health authorities of Mexico and Canada agreed to strengthen technical and scientific collaboration, in order to protect the region's agro-alimentary heritage.

For more than 25 years, Mexico and Canada have shared an intense commercial relationship in agro-alimentary matters, and that is because we currently exchange more than 50 agricultural, livestock, aquaculture and fishing goods, among which are strawberries, avocado, wheat, birdseed, citrus, mango, watermelon, poultry and beef, shrimp, lobster, bream and sardines.

The success of this association is mainly due to the understanding between Senasica and the Canadian Food Inspection Agency (CFIA), which permanently share experiences to make the safe exchange of food more efficient.

On this year, health authorities of both countries have agreed to strengthen technical and scientific collaboration with Canada, in order to protect the region's agro-alimentary heritage against threats such as highly pathogenic avian influenza A(H5N1), which currently threatens poultry farming throughout the Americas.
