

Origin Verification - Plant Import

When a product is verified in its country of origin, it facilitates its entry for the benefit of users

Origin Verification helps to verify the phytosanitary conditions of the production, certification, packaging and facilities systems. This procedure makes it possible to import products identified as "at risk" due to pest problems; therefore, an option is studied and analyzed to minimize its risk to be imported.

When products come from different countries, this Origin Verification requirement must be met, which was established as part of the phytosanitary risk mitigation measures.

The validity can be up to one year, depending on the species, type of regulation for such goods and conditions of production unit, whether it is primary or an establishment.
