

Systems for Contamination Risk Reduction

Measures and procedures to reduce contamination hazards and ensure optimal production and processing conditions

With the effective application of a System for Contamination Risk Reduction (CRRS, in Spanish), supported by legal, technical and scientific instruments, national producers strengthen their activities, giving certainty to national and international consumers that the food products offer is one that reduced the risk of affecting their health due to some type of contamination.

To ensure compliance, Good Practices manuals, guidelines, and formats have been developed and published to serve as a guide for producers to implement an SRRC. Those who comply with these guidelines and are interested in certification may apply for it in the different programs of the agricultural, livestock, aquaculture and fisheries components offered by Senasica's General Directorate of Food and Agriculture, Aquaculture and Fisheries Safety.
